

Contribution intake review

Local owner · Manual / API · Fixed release 1

Apply the repository’s contribution policy consistently, with the evidence needed to understand each result and follow up on gaps.

Scope & operation

Evaluate one playbook, dataset, skill, source update or domain brief per submission. The local owner starts a run manually or through the API. Each run uses the fixed Contribution Acceptance Review release.

Evidence required for every submission

Automated check receipt — record of content tests and skill validation.	Required
Privacy scan log — check for person-level data in submitted records.	Required
Source register verification — registered sources and access conditions.	Required

Each run needs its own evidence. An availability declaration does not attach a document.

How results are handled

Record acceptance, rejection or an unresolved result. Preserve any requested maintainer handoff. A request for review is not a completed review; this job does not send an external approval or message.

Readiness gaps

No saved behavioral test run is linked to this release. Source artifact bindings need setup, and no readiness review is recorded. Structural validation alone does not establish policy suitability.

Before regular use

The owner should bind the source artifacts, attach a test run for the exact release and arrange a readiness review before relying on this job for recurring work.
