

Missing privacy scan

Contribution Acceptance Review · Case revision 3 · Pack 0.1.0

Check that missing privacy evidence keeps a contribution unresolved, even when the submitted facts report no personal data.

Scenario

A playbook contribution reports successful automated checks, traceable claims and accessible sources. Its privacy scan log is deliberately omitted. This isolates the pack’s handling of missing required evidence.

Required evidence

Automated check receipt — record of content tests and skill validation.	Provided
Privacy scan log — check for person-level data in submitted records.	Missing
Source register verification — registered sources and access conditions.	Provided

The supplied files have not been assessed for adequacy. Their presence alone does not establish that the contribution is acceptable.

Expected & observed result

Expected: unresolved, with a Repository Maintainer handoff. Test run 28 produced that result, so the case passed. This confirms the saved expectation; it does not approve the contribution.

Limits & open questions

This case does not establish the source material’s meaning or resolve objections to the playbook. The evidence assumptions still need reviewer assessment before the case supports a release.

Next step

Have the test owner review the assumptions, then add a companion case with the privacy scan supplied to check the acceptance path.
